

Mini UX and UI Audit

Cloud Power · Current site vs redesign

Summary

The redesign keeps all the content of cloud-power.eu. It makes the site easier to read, faster, and clearer about what to do next.

	Current site	Redesign
Text readability	19 texts hard to read	Stronger contrast; two small colours still to fix (O-2)
Fonts	4 different fonts	One main font + a monospace font for labels
Buttons	5 different styles	One consistent button system
Menu	8 links of equal weight	Services menu and one button
Speed on phone (out of 100)	68–78	91–99
Ways to get in touch	9 links with 5 different labels	3 buttons, all “Contact Us”
Contact form	2 different forms	1 form
Unfinished pages	Template pages are public	Removed

What was wrong?

The current cloud-power.eu has good content, but it is hard to use. Light cyan text and buttons are hard to read, and four fonts and five button styles make the site look inconsistent. On the homepage, services are only icons with names. Visitors meet nine different contact links, two booking links and two contact forms, and pages load slowly on phones.

The six findings below show the main differences. The full audit covers 20 findings with all screenshots and measurements.

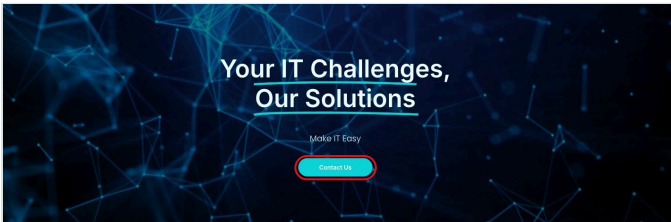

Key findings

1 · First screen

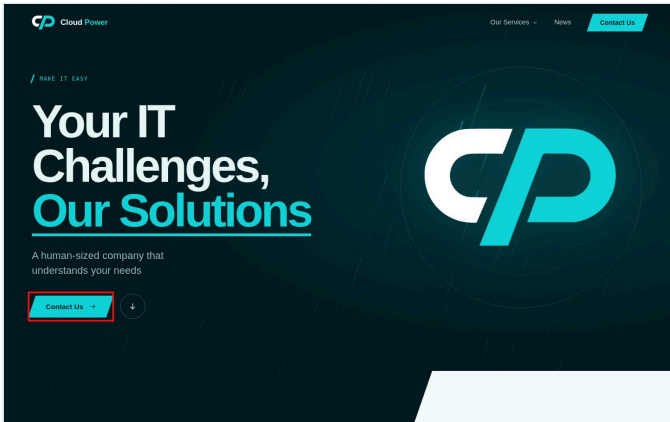

Current site. The first screen shows the slogan and “Make IT Easy”. The main Contact Us button has white text on light cyan (1.85:1).

Redesign. The slogan is the page’s one H1, with “A human-sized company that understands your needs” under it and one Contact Us button with dark text on cyan (9.7:1).

Why it is better. Visitors see who Cloud Power is and what to do next, and the main button is easier to read.

Current site — Homepage, first screen

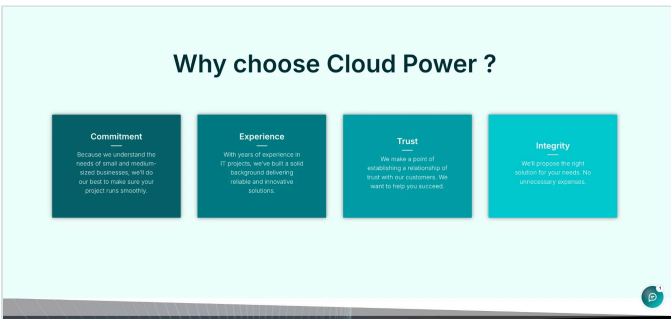

Redesign — index.html, first screen

2 · Colour and contrast

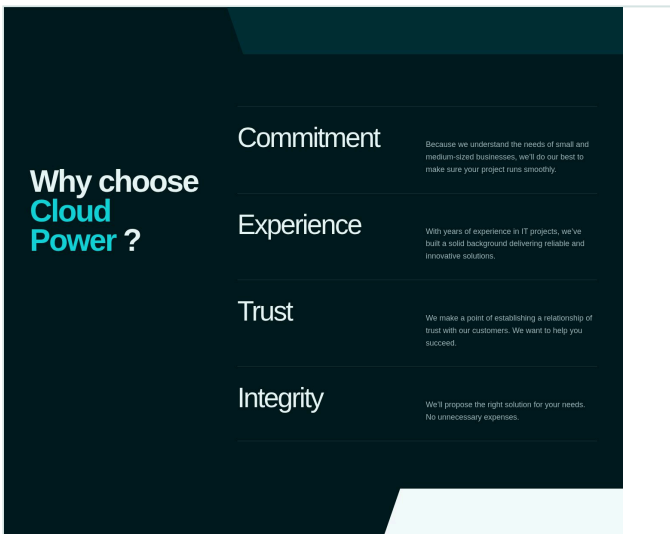

Current site. Light cyan carries text: page titles 1.79:1, white on cyan 1.85:1, Why Choose boxes 2.04–3.25:1. WCAG AA requires 4.5:1 for normal text.

Redesign. One palette. Cyan is kept for buttons and highlights, with dark text on it; a darker cyan ink on light backgrounds; body text at 9.9:1.

Why it is better. Text is easier to read, including for people with low vision and those using phones outdoors. Cyan highlights key elements, helping users find the main action faster.

Current site — Homepage → Why choose Cloud Power

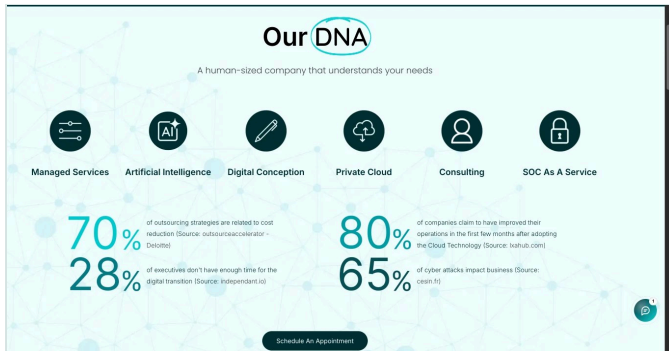

Redesign — index.html → Why choose Cloud Power

3 · Services on the homepage

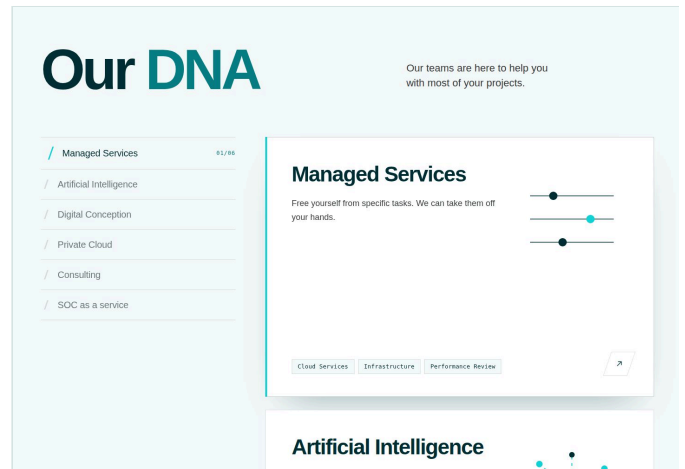

Current site. The six services are shown as round icons with names only. Descriptions are only on the inner pages.

Redesign. A numbered index and one panel per service, with its own description, sub-offers and a link to its page.

Why it is better. Visitors can compare all six services in one scroll and open the right page with a clear expectation.

Current site — Homepage → Our DNA

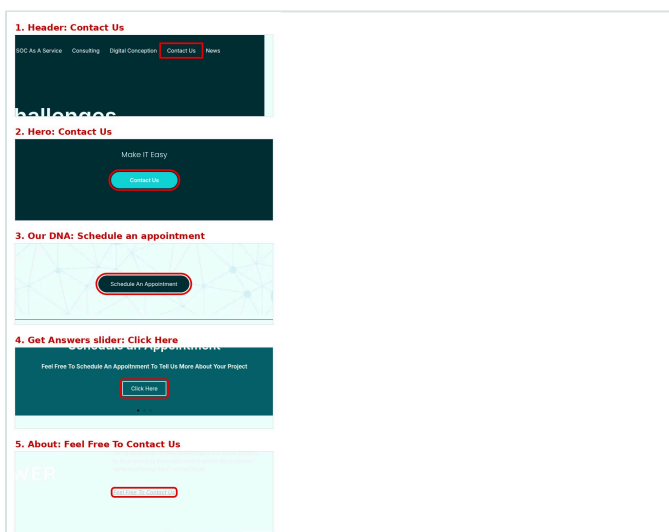

Redesign — index.html → Our DNA

4 · Calls to action

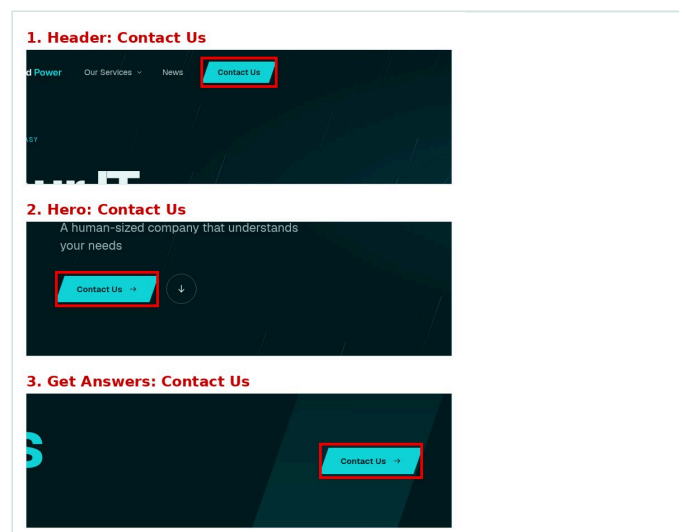

Current site. The homepage asks for contact 9 times with 5 different labels, and two different booking links are in use.

Redesign. One consistent button system and one label, "Contact Us", in three places: the header, the hero and the end of the page. One destination: the Contact page.

Why it is better. The action is easy to find without being repeated until it becomes noise, and enquiries are easier to track.

Current site — Homepage: the 5 visible contact actions

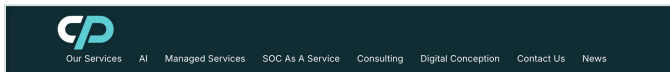

Redesign — index.html: the 3 Contact Us buttons

5 • Navigation

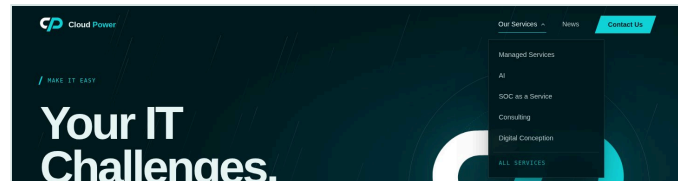

Current site. The header has 8 equal links, and Contact Us looks like any other link.

Redesign. An “Our Services” menu, News, and a filled Contact Us button. The header hides while scrolling down and returns on scroll up.

Why it is better. The navigation groups eight links into three main choices and gives Contact Us greater visual prominence.

Current site — Header bar, desktop

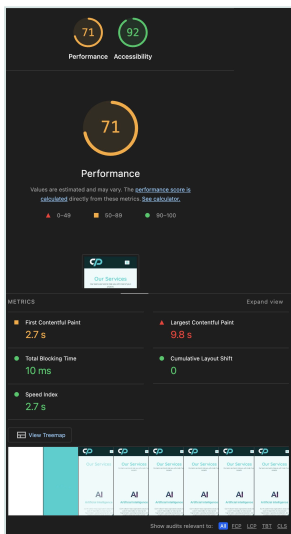

Redesign — Header with the Our Services menu open

6 • Speed on phones

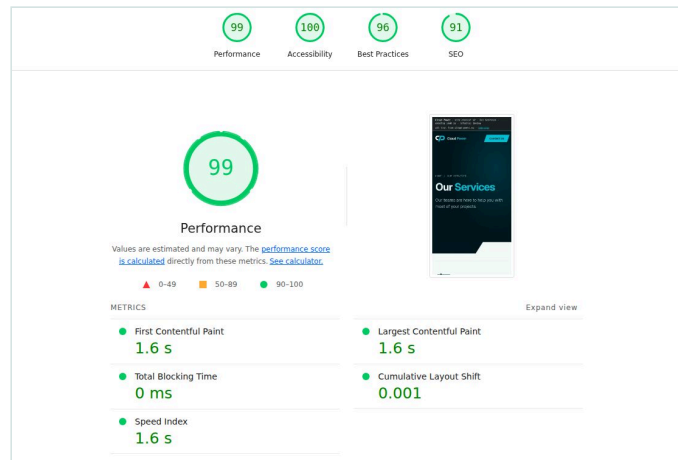

Current site. Lighthouse mobile Performance 68–78. LCP 3.1–5.6 s, and 9.8 s on Our Services in a repeat run; the target is 2.5 s.

Redesign. Performance 91–99 and LCP 1.6–3.0 s on the six measured design pages, which weigh 89–412 KB.

Why it is better. All six measured pages are faster. The homepage hero still needs tuning to reach the 2.5 s LCP target (O-3).

Current site — Lighthouse, Our Services, mobile

Redesign — Lighthouse, our-services.html, mobile

Conclusion

One colour palette with stronger contrast, one main font family with Geist Mono for small labels, and one consistent button system. Each service shows what it does. There is one "Contact Us" action and one form. Pages are lighter and load faster on phones.

Next steps

Finish the mobile version (O-1)

- Add a menu button for phones with Our Services and News. The current site has one, so the redesign should not launch without it.

Fix the last two colours (O-2)

- Make the small grey text darker (#5A686B).
- Use bright cyan (#12D3D8) for links on dark backgrounds.

Speed up the homepage (O-3)

- Start the hero animation after the page appears.
- Draw fewer light streaks on phones, and pause the animation when the tab is hidden.

Build trust (O-4)

- Add approved client logos and 2–3 short case studies.

Finish the build (O-5)

- Add a meta description to every page.
- Fix the spelling copied from the live site: "appointment" (correct: "appointment"), "Environnement" ("Environment" in English text), "Soc as a Service" ("SOC as a Service"), and "access to water.." ("access to water.").
